WEGSARS Ver. 3.04

This is an error correction release, and it depends upon a prior installation of WEGSARS Ver. 3.00 or 3.01 on your computer. This release is cumulative; that is, it includes the fixes that were previously released in version 3.02 and 3.03. Installation of this release is not required. However, it corrects problems that have affected some users:

- problems encountered in importing a report
- problems zipping the export and backup files
- problems saving data on the Pumping and Purchased Water Statistics schedule.

Even if you have not encountered these problems, you are encouraged to install the release.

Installation Instructions

Click the Start menu and select Run. Key in the drive and location where setup.exe was unzipped to (for example: **C:\PSC\WEGSARS3\INSTALL\setup.exe**), click **OK**, and follow the instructions on the screen.

List of enhancements:

- Zip capabilities – registered additional file on install to allow Zip capabilities on machines where this did not work before
- Database Import – corrected problem that prevented imports on some machines.
- Backup Database – Added popup window back in to allow users to specify where they want to save the backup file. This is in addition to the backup copy stored in the Export directory. Modified documentation to reflect this.
- Export Database – Added popup window back in to allow users to specify where they want to save the export file. This is in addition to the copy stored in the Export directory. Modified documentation to reflect this.
- Install sets option to prompt for schedule status on schedule close.
- Added data to allow printing of the blank Gas report
- Corrected minor problems in printing lines on various other blank reports
- Cover Sheet – corrected form number for class C
- Pumping and Purchased Water Statistics – allows numbers greater than 32,000 in new fields

Installation will prompt for a prior install of WEGSARS Version 3.00 or 3.01, and will terminate if neither has yet been installed. Install does not include database files, so there is no worry about overwriting existing data. Install detects locations of existing installed files and writes to the same directories. Install will not change any of the options other than the prompt for schedule status.
